Redes neuronales artificiales con Keras

Este notebook contiene todo el código fuente requerido para la solución de los talleres propuestos.

[Ejecutar en Google Colab]

Configuración

Primero, importemos algunos módulos comunes, asegurémonos de que MatplotLib traza las figuras en línea y preparemos una función para guardar las figuras. También verifiquemos que Python 3.5 o posterior esté instalado (aunque Python 2.x puede funcionar, está obsoleto, por lo que recomendamos encarecidamente que use Python 3 en su lugar), así como Scikit-Learn ≥0.20 y TensorFlow ≥2.0.

In [1]:

```
# Python ≥3.5 es requerido
import sys
assert sys.version_info >= (3, 5)

# Scikit-Learn ≥0.20 es requerido
import sklearn
assert sklearn.__version__ >= "0.20"

try:
    # %tensorflow_version solo existe en Colab.
    %tensorflow_version 2.x
except Exception:
    pass

# TensorFlow ≥2.0 es requerido
import tensorflow as tf
assert tf.__version__ >= "2.0"

# Importar librerías comunes
import numpy as np
import os

# para que la salida de este notebook sea estable en todas las ejecuciones
np.random.seed(42)

# Para dibujar figuras estéticas
%matplotlib inline
import matplotlib as mpl
import matplotlib.pyplot as plt
mpl.rc('axes', labelsize=14)
mpl.rc('xtick', labelsize=12)
mpl.rc('ytick', labelsize=12)

# En donde almacenar las figuras
PROJECT_ROOT_DIR = "."
CHAPTER_ID = "ann"
IMAGES_PATH = os.path.join(PROJECT_ROOT_DIR, "images", CHAPTER_ID)
os.makedirs(IMAGES_PATH, exist_ok=True)

def save_fig(fig_id, tight_layout=True, fig_extension="png", resolution=300):
    path = os.path.join(IMAGES_PATH, fig_id + "." + fig_extension)
    print("Saving figure", fig_id)
    if tight_layout:
        plt.tight_layout()
    plt.savefig(path, format=fig_extension, dpi=resolution)

# Ignorar las advertencias inútiles (consulte el número 5998 de SciPy)
import warnings
warnings.filterwarnings(action="ignore", message="^internal gelsd")
```

Perceptrones

Nota: establecemos `max_iter` y `tol` explícitamente para evitar advertencias sobre el hecho de que su valor predeterminado cambiará en futuras versiones de Scikit-Learn.

In [2]:

```
import numpy as np
from sklearn.datasets import load_iris
from sklearn.linear_model import Perceptron

iris = load_iris()
X = iris.data[:, (2, 3)]  # largo del pétalo, ancho del pétalo
y = (iris.target == 0).astype(np.int)

per_clf = Perceptron(max_iter=1000, tol=1e-3, random_state=42)
per_clf.fit(X, y)

y_pred = per_clf.predict([[2, 0.5]])
```

In [3]:

```
y_pred
```

Out[3]:

```

```

Construyendo un clasificador de Imágenes

Primero, importemos TensorFlow y Keras.

In [9]:

```
import tensorflow as tf
from tensorflow import keras
```

In [10]:

```
tf.__version__
```

Out[10]:

```
'2.3.1'
```

In [11]:

In [11]:

```
keras.__version__
```

Out[11]:

```
'2.4.0'
```

Comencemos cargando el conjunto de datos de moda MNIST. Keras tiene una serie de funciones para cargar conjuntos de datos populares en `keras.datasets`. El conjunto de datos ya está dividido entre un conjunto de entrenamiento y un conjunto de prueba, pero puede ser útil dividir el conjunto de entrenamiento más para tener un conjunto de validación:

In [12]:

```
fashion_mnist = keras.datasets.fashion_mnist
(X_train_full, y_train_full), (X_test, y_test) = fashion_mnist.load_data()
```

El conjunto de entrenamiento contiene 60.000 imágenes en escala de grises, cada una de 28x28 píxeles:

In [13]:

```
X_train_full.shape
```

Out[13]:

```
(60000, 28, 28)
```

Cada intensidad de píxel se representa como un byte (de 0 a 255):

In [14]:

```
X_train_full.dtype
```

Out[14]:

```
dtype('uint8')
```

Dividamos el conjunto de entrenamiento completo en un conjunto de validación y un conjunto de entrenamiento (más pequeño). También escalamos las intensidades de píxeles hasta el rango 0-1 y las convertimos en flotantes, dividiéndolas por 255.

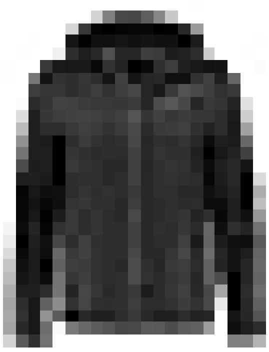
In [15]:

```
X_valid, X_train = X_train_full[:5000] / 255., X_train_full[5000:] / 255.
y_valid, y_train = y_train_full[:5000], y_train_full[5000:]
X_test = X_test / 255.
```

Puede trazar una imagen usando la función `imshow ()` de Matplotlib, con un `'binario'` mapa de color:

In [16]:

```
plt.imshow(X_train[0], cmap="binary")
plt.axis('off')
plt.show()
```



Las etiquetas son los ID de clase (representados como uint8), de 0 a 9:

In [17]:

```
y_train
```

Out[17]:

```
array([4, 0, 7, ..., 3, 0, 5], dtype=uint8)
```

Aquí están los nombres de clase correspondientes:

In [18]:

```
class_names = ["T-shirt/top", "Trouser", "Pullover", "Dress", "Coat",
               "Sandal", "Shirt", "Sneaker", "Bag", "Ankle boot"]
```

Entonces, la primera imagen del conjunto de entrenamiento es un abrigo:

In [19]:

```
class_names[y_train[0]]
```

Out[19]:

```
'Coat'
```

El conjunto de validación contiene 5000 imágenes y el conjunto de prueba contiene 10000 imágenes:

In [20]:

```
X_valid.shape
```

Out[20]:

```
(5000, 28, 28)
```

In [21]:

```
X_test.shape
```

Out[21]:

```
(10000, 28, 28)
```

Echemos un vistazo a una muestra de las imágenes en el conjunto de datos:

In [22]:

```
n_rows = 4
n_cols = 10
plt.figure(figsize=(n_cols * 1.2, n_rows * 1.2))
for row in range(n_rows):
    for col in range(n_cols):
        index = n_cols * row + col
        plt.subplot(n_rows, n_cols, index + 1)
        plt.imshow(X_train[index], cmap="binary", interpolation="nearest")
        plt.axis('off')
        plt.title(class_names[y_train[index]], fontsize=12)
plt.subplots_adjust(wspace=0.2, hspace=0.5)
save_fig('fashion_mnist_plot', tight_layout=False)
plt.show()
```

```
Saving figure fashion_mnist_plot
```

In [23]:

WARNING:tensorflow:From <ipython-input-44-81ace37e545f>:1: Sequential.predict_classes (from
tensorflow.python.keras.engine.sequential) is deprecated and will be removed after 2021-01-01.
Instructions for updating:
Please use instead:* `np.argmax(model.predict(x), axis=-1)`,   if your model does multi-class
classification   (e.g. if it uses a `softmax` last-layer activation).* `(model.predict(x) > 0.5).as
type("int32")`,   if your model does binary classification   (e.g. if it uses a `sigmoid` last-
layer activation).
